

AHMAD RIFAI

Software Engineer · Game Programmer · 10+ Years · C++ / C# / Unity
Indonesia (open to remote) | arifai.dev@gmail.com | github.com/rifai | rifai.id/games

Summary

Software engineer with 10+ years building and shipping games, spanning Unity/C# and hands-on C/C++ engine-level development. Shipped a Steam title ("Very Positive") and engineered officially licensed games for global IP partners including Rovio and ZeptoLab. Strong in gameplay and systems code, performance optimization, physics/math programming, and cross-discipline collaboration.

Skills

Languages: C++ / C, C# (Expert), GDScript, Haxe, Python

Engines & Tools: Unity3D (Expert), Urho3D, Godot, OpenFL, Blender (API), Git, GitHub Actions

Core Competencies: Engine Architecture, Physics/Math Programming, Performance & Memory Optimization, Gameplay & UI Systems, Tool Development, CI/CD, JNI (Android Native)

Experience

Abersoft Studio — Game Programmer

Feb 2024 – Present

- Lead engineering for the studio's casual and mid-core mobile portfolio, including *Bubble Tower – Idle Defense* and *Find Hidden Objects: Time Tale*, developing systems and gameplay code from prototype to release on Android and iOS.
- Drove performance optimization on low-end Android devices, targeting memory overhead and frame stability and raising the crash-free rate above 98% for titles with 10K+ downloads.
- Built complex mobile UI systems — in-game shop, HUD, bottom navigation — fully responsive across phone and tablet layouts.
- Established CI/CD pipelines with GitHub Actions to automate Google Play builds, and integrated third-party SDKs (AdMob, Firebase) for monetization and analytics across live titles.
- Perform code reviews and mentor junior developers on architecture and coding standards.

Crescentyr — Game Programmer (Part-time)

Oct 2014 – Present

- Engineer officially licensed educational games for global IP partners, commissioned through Legends of Learning, to the quality standards required by major franchise owners:
 - "Cut the Rope: Forces and Motion" (2025) — partnered with ZeptoLab; implemented rope physics, gravity mechanics, and interaction systems.
 - "Angry Birds Eggstraction" (2024) — collaborated with Rovio; translated the franchise's signature collision mechanics into a physics module in Unity3D.
- Shipped 15+ optimized HTML5/WebGL titles, engineering asset pipelines that hold build sizes under 15 MB (well below the 30 MB platform limit) without sacrificing fidelity.
- Currently building new titles in the Godot Engine, expanding from Unity/C# into GDScript.

Mojiken Studio — Game Programmer

Feb 2016 – Jan 2018

- Core programmer on *She and the Light Bearer*, a point-and-click adventure released on Steam in 2019 (published by Toge Productions), holding a "Very Positive" player rating.
- Heavily extended the Fungus visual-novel framework to support bespoke mini-games and non-standard gameplay loops, integrating custom logic into the narrative engine.

Technical Projects & Engine Development

Bolderline — Puzzle game (C/C++, Urho3D)

2018

- Independently developed a complete cross-platform puzzle game on the Urho3D engine, using C/C++ for low-level engine programming and AngelScript for gameplay logic.
- Implemented an Android JNI layer bridging the C/C++ engine with Java for Google Play Services, and compiled to web via Emscripten (C++/JavaScript).

Ucupaint — Blender add-on (Python)

Sept 2023 – Present

- Contributor to an open-source Blender texture-layer add-on (2,100+ GitHub stars, 46 releases), including an auto-update system and RESTful API integration to fetch PBR textures from ambientCG.

Education

Institut Teknologi Sepuluh Nopember — B.Eng. in Software Engineering

2007 – 2011
